

**COLUMBIA RIVER TREATY ENTITY AGREEMENT ON THE  
DETAILED OPERATING PLAN  
FOR CANADIAN STORAGE  
1 AUGUST 2012 THROUGH 31 JULY 2013**

Article XIV 2.(k) of the Columbia River Treaty between Canada and the United States of America (Treaty) provides that the power and duties of the Entities include “*preparation and implementation of detailed operating plans that may produce results more advantageous to both countries than those that would arise from operation under the plans [Assured Operating Plans (AOP)] referred to in Annexes A and B.*”

The Entities agree that Canadian storage shall be operated and electric power delivered in accordance with the attached “Detailed Operating Plan for Canadian Storage – 1 August 2012 through 31 July 2013” (the 2012-13 Detailed Operating Plan), dated June 2012.

The Entities agree that the “Columbia River Treaty Principles and Procedures for Preparation and Use of Hydroelectric Operating Plans for Canadian Treaty Storage,” dated November 2003, or any future document the Entities agree supersedes the 2003 document, and any Appendices approved by the Operating Committee, will guide the Entities in implementing the 2012-13 Detailed Operating Plan.

In witness thereof, the Entities have caused this Agreement to be executed.

Executed for the Canadian Entity this 27<sup>th</sup> day of MAY, 2012.

**COLUMBIA RIVER TREATY  
DETAILED OPERATING PLAN  
FOR CANADIAN STORAGE  
1 AUGUST 2012 THROUGH 31 JULY 2013**

**I. REFERENCES AND INTERPRETATION**

In this document:

- A. “Aspects Agreement” means the Entity Agreement on Aspects of the Delivery of the Canadian Entitlement for 1 April 1998 through 15 September 2024 between the Canadian Entity and the United States Entity, dated 29 March, 1999, together with its Attachment A – Points of Delivery and Attachment B - Scheduling Guidelines, as those Guidelines may be subsequently modified or amended by the Operating Committee.
- B. “Assured Operating Plan” (AOP) means the hydroelectric operating plan developed in accordance with the Columbia River Treaty (Treaty) for the Operating Year as further described in the document “Columbia River Treaty Hydroelectric Operating Plan - Assured Operating Plan for Operating Year 2012-13 (AOP13) dated January 2008.”
- C. “Canadian storage” and “Canadian Treaty Storage” mean the storage provided by Canada under Article II of the Treaty, which is a total of 19.119 cubic kilometers ( $\text{km}^3 = 10^9$  cubic meters) (15.5 million acre feet (Maf)) at the Mica, Duncan, and Arrow reservoirs.
- D. “Detailed Operating Plan” (DOP) means a detailed operating plan prepared for the Operating Year by the Operating Committee pursuant to the guidelines provided in the Principles and Procedures and consisting of the contents of this document.
- E. “Flood Control Operating Plan” (FCOP) means the document “Columbia River Treaty Flood Control Operating Plan, dated May 2003”, including any published updates.
- F. “Libby Coordination Agreement (LCA)” means the “Columbia River Treaty Entity Agreement Coordinating the Operation of the Libby Project With the Operation Of Hydroelectric Plans on the Kootenay River and Elsewhere in Canada”, dated 16 February 2000.
- G. “Libby Operating Plan” (LOP) means the operating plan prepared by the U.S. Army Corps of Engineers (“Corps of Engineers”) on behalf of the U.S. Entity for the Libby project in accordance with Section 9 of the LCA, and incorporated as Attachment B to the LCA.
- H. “Operating Committee” means the Columbia River Treaty Operating Committee.
- I. “Operating Year” means the period from 1 August 2012 through 31 July 2013.

- J. “Principles and Procedures” (POP) means the document “Columbia River Treaty Principles and Procedures for Preparation and Use of Hydroelectric Operating Plans for Canadian Treaty Storage,” dated October 2003, or any future document the Entities agree supersedes the 2003 document, and any updated Appendices approved by the Operating Committee.
- K. “Supplemental Operating Agreement” (SOA) means any operating agreement(s) (signed either by the Entities or the Operating Committee) that authorize Canadian storage operations above or draft below the Treaty Storage Regulation levels as described in Section IV(A) of this DOP and Section 11 of the LCA, but not including Section 10 of the LCA.
- L. “Treaty Storage Regulation” (TSR) means the Coordinated System hydro regulation study performed for the Operating Committee by Bonneville Power Administration (BPA) staff using actual and forecasted streamflow conditions and implementing operating criteria contained in this DOP, including any changes agreed to under subsection II(E), but excluding subsections IV(D) and SOA operations authorized under subsection IV(A). The TSR is used in accordance with POP and this DOP to determine operational Treaty rights to monthly regulation of Treaty storage.
- M. “Weekly Treaty Storage Operation Agreement” means the note electronically transferred (e-mail or Fax) the last working day of each week from the U.S. Section to the Canadian Section of the Operating Committee to confirm the verbal agreement by the Operating Committee for the weekly Treaty storage changes and outflows that implement this DOP, including any changes agreed to under subsection II(E) and Section IV.

Other capitalized terms used in this document, not defined above, should be interpreted to have the meaning ascribed to them in POP (either in the definitions or the text), the FCOP or the generally accepted meaning within the industry in the Columbia River Basin.

## **II. PREPARATION AND SCOPE**

### **A. General**

This DOP for Canadian storage is based on the operating criteria contained in the AOP13 and its supporting hydro regulation studies with agreed revisions noted in subsection II(D) below, together with scheduling procedures and mutually beneficial changes from the AOP13 data agreed to by the Entities.

This DOP was developed in accordance with the procedures outlined in the POP and incorporates the use of the International System of Units (SI, or Metric); however, for operational purposes, reliance should be placed on measurements in the English system.

### **B. Storage Amounts**

The usable Canadian storage space available for power purposes during the Operating Year is 19.119 km<sup>3</sup> (15.5 Maf) in Canada distributed as follows:

#### Duncan Reservoir

1.727 km<sup>3</sup> (1.4 Maf or 705.8 thousand second-foot-days (ksfd)) between elevations

576.68 meters (m) (1892.0 feet) and 546.87 m (1794.2 feet) as measured at Duncan forebay, and based on British Columbia Hydro and Power Authority (B.C. Hydro) table dated 21 February 1973.

Arrow Reservoir

8.758 km<sup>3</sup> (7.1 Maf or 3579.6 ksf) between elevations 440.13 m (1444.0 feet) and 419.98 m (1377.9 feet) as measured at Fauquier, B.C., and based on B.C. Hydro table dated 28 February 1974.

Mica Reservoir

8.634 km<sup>3</sup> (7 Maf or 3529.2 ksf) between elevations 754.38 m (2475.0 feet) and 707.41 m (2320.9 feet) as measured at Mica forebay, and based on B.C. Hydro table dated 25 March 1974. The total available storage between these elevations is 14.802 km<sup>3</sup> (12 Maf, 6050.0 ksf), but only 8.634 km<sup>3</sup> (7 Maf, 3529.2 ksf) of this storage is utilized for power purposes, except as described in paragraph VII(C)6.

**C. Flood Control**

The requirements for flood control operations are defined in the Treaty and the FCOP. In accordance with Section 6-6 of the FCOP, the Canadian Entity selected for the AOP13 a reallocation of Mica/Arrow system flood control space to be 5.033 km<sup>3</sup> (4.08 Maf) at Mica and 4.441 km<sup>3</sup> (3.6 Maf) at Arrow for the Operating Year. The usable Canadian storage available for normal flood control purposes during the Operating Year will be 1.567 km<sup>3</sup> (1.27 Maf) in Duncan Reservoir below elevation 576.68 m (1892.0 feet), 4.441 km<sup>3</sup> (3.6 Maf) in Arrow Reservoir below elevation 440.13 m (1444.0 feet), and 5.033 km<sup>3</sup> (4.08 Maf) in Mica Reservoir. Additional storage may also be operated for flood control purposes under special circumstances, as described in Section 3-2 of the FCOP.

During the 2012-13 Operating Year, the Canadian Entity may request a different allocation of Mica/Arrow system flood space. To the extent that the flood control storage allocation differs from that included in the AOP13, the Operating Committee will develop and execute an agreement that will result in the same Treaty flows at the U.S.-Canadian border as that provided in the AOP13 as modified in subsection II(D), unless otherwise agreed by the Operating Committee.

During the refill period, the Canadian Section of the Operating Committee may request local flood control elevations for Arrow with the intent to minimize the occurrence of flows above 165 kcfs at Trail (as measured at Birchbank). This local flood control objective which is below 225 kcfs will be included in the flood control rule curve and input as the Upper Rule Curve in the TSR studies only to the extent that it does not jeopardize system flood control needs.

In order to accommodate local minimum flow requirements downstream of Duncan Dam, the Canadian Entity has requested a permanent variance beginning with the 2009-10 Operating Year and beyond to the February Duncan flood control draft requirements in the May 2003 FCOP. The Corps of Engineers has agreed to the permanent variance as described in subsection II(D)2 below.

**D. Preparation of the Treaty Storage Regulation Study**

The TSR study uses DOP operating criteria for both Canadian and U.S. projects to define a Canadian storage operation. The TSR13 study shall be based on the loads, thermal and other resources, rule curves, non-power constraints, and other plant and operating data contained in the AOP13 Step I hydro regulation study, except for the following changes agreed to by the Entities.

1. Flood control rule curves for Canadian projects defined as noted in subsection II(C) above unless otherwise agreed by the Operating Committee.
2. Limiting Duncan end of February flood control rule curve to no lower than 1812.5 feet (usable content 93.2 ksf). This change does not affect the critical period studies.
3. Use of the hydro-independent (HI) generation included in the Actual Energy Regulation (AER) (28 projects) plus the 70-year median values from the AOP13 for HIs not updated in the AER. To make this process more consistent with the PNCA AER, the HI operation of the eight Willamette projects will be added to the TSR hydro-regulation model and the same inflow and elevation data as submitted for the AER will be used.
4. In accordance with Attachment C to the LCA, the maximum January outflow at Arrow in the TSR is limited to 2,265 m<sup>3</sup>/s (80,000 cfs). However, the AOP13 value of 1,982 m<sup>3</sup>/s (70,000 cfs) overrides this requirement as shown in Table 1.
5. Forecast errors and distribution factors will be based on the September 2010 update to Appendix 8 of the 2003 POP. The Operating Committee may revise forecast errors and distribution factors in accordance with subsection II(E).
6. The Feb. 1, 2012 PNCA data submittal for Grand Coulee pumping flows (based on net flow from pumping and generation at the pumps/generators) or current forecast values if available will be used for current and future months. Actual values for after-the-fact months will be used. Adjustments to return flows are not needed because the observed streamflows and streamflow forecasts include return flows.
7. Updated plant data for Mica storage/elevation table, Arrow maximum generation, and an additional data point to the Duncan storage/elevation table, based on the Feb. 1, 2008 PNCA data submittal, and for Mica (generation), Revelstoke (generation), and Brilliant unit updates and expansion, based on the Feb. 1, 2010 PNCA data submittal. Use of updated surcharge storage/elevation tables for the Canadian Storage projects.
8. Updated Grand Coulee and Hungry Horse storage/elevation tables to the Feb. 1, 2008 PNCA data submittal, which includes a reduction in total usable storage at Hungry Horse of 45.1 ksf due to no longer including the assumption of 3% bank storage. The AOP13 rule curves for Hungry Horse (CRC, ARC, VRC, ORCLL, & URC) will be adjusted to subtract 45.1 ksf from all values, limited to empty, to avoid impact on system storage operation due to the updated data. In the event that

the adjustment to Hungry Horse rule curves causes additional Canadian draft in the TSR, which might happen during system operation below the 3<sup>rd</sup> year critical rule curve, the Operating Committee shall agree on a procedure to modify the TSR to prevent the additional Canadian draft.

9. Forecasted streamflows as a percentage of 71-year medians from the 2000 Modified Flows without Grand Coulee pumping will be used.
10. The hydro regulation model used will be PCHYDSIM version 28, or later version if agreed by the Operating Committee.
11. During the flood control evacuation period, the flood control curves at Grand Coulee may be adjusted to recognize drafts below the flood control levels at upstream storage reservoirs (including Canadian Treaty projects) in accordance with the latest update to the “Standard Operating Procedure for Computation of Flood Control Criteria for Treaty Storage Regulation and Actual Energy Regulation Models” agreed to by the Operating Committee.
12. The Dworshak operation will be updated as defined by the Feb. 1, 2012 PNCA data submittal with total minimum outflow of 45.31 m<sup>3</sup>/s (1600 cfs). This represents a minimum release of 42.47 m<sup>3</sup>/s (1500 cfs) through the powerhouse and 2.83 m<sup>3</sup>/s (100 cfs) of miscellaneous flow for the hatchery.
13. Updated 70-year Energy Content Curves for Ross, based on the Feb. 1, 2011, PNCA data submittal and as updated in the PNCA AER.
14. The operation of Mossyrock, Mayfield, Swift #1, Swift #2, Merwin, Alder, and Yale will be based on past actual inflows and elevations, and median inflows and median Variable Energy Content Curves for future months.
15. Use of updated plant data including H/K values, storage elevation tables, tailwater rating curves, maximum generation table and full gate h/k values for 14 federal projects based on the PNCA Feb 1, 2011 data submittal.

Although not changed from the AOP13, some notable assumptions for this TSR include:

16. U.S. flood control curves will include VarQ at Hungry Horse but not at Libby, and will not include Variable End-of-December flood control rule curves at Libby or shifted flood control from Brownlee and/or Dworshak to Grand Coulee.
17. The Canadian flood control curves will not include impacts due to VarQ and Variable End-of-December flood control rule curves at Libby or any impacts related to shifting of flood control from Brownlee and/or Dworshak to Grand Coulee unless otherwise agreed by the Operating Committee.
18. Arrow Project Operating Criteria (APOC) will be updated based on the procedures defined in subsection VII(B)7 of this DOP. This includes minimum flow limits at Arrow of 283.16 m<sup>3</sup>/s (10,000 cfs) for all months from July to January and April 15-30 to May, 566.33 m<sup>3</sup>/s (20,000 cfs) from February through March,

424.75 m<sup>3</sup>/s (15000 cfs) for April 1-15, and 141.58 m<sup>3</sup>/s (5000 cfs) for June. This operating limit may be reduced as needed to as low as 141.58 m<sup>3</sup>/s (5000 cfs) to avoid drafting the combined Mica and Arrow storage beyond 17.39 km<sup>3</sup> (14.1 Maf).

19. Brownlee's storage operation will be based on critical rule curves and energy content curves included in the AOP13, but the project minimum outflows will be calculated based on the minimum flow requirement at Lime Point.
20. The Variable Refill Curve Lower Limits (VRCLLs) were eliminated for all projects except Grand Coulee, which used a fixed VRCLL for all three forecast levels, 98.7, 117.2 and 135.7 km<sup>3</sup> (80, 95, and 110 Maf). The January and February Grand Coulee VRCLL values are the same as its ORCLL and are based on historic minimum elevations for firm power operation of 373.38 m (1225 feet) in March-April, 377.95 m (1240 feet) in May, and 391.67 m (1285 feet) in June.

The TSR includes the operating guides and limits listed in Sections VI and VII of this DOP.

**E. Authorization for Changes to the TSR**

The Operating Committee is authorized to modify the TSR only as needed to correct errors or omissions, update forecast data and procedures, and update the hydroregulation model.

**F. Libby**

Libby operating limits and the expected operation of the Libby project are not included in the DOP. That information is available in the Libby Operating Plan that will be updated by the U.S. Entity when planned operations change. The operation of Libby in the TSR13 will be based on the AOP13 Step 1 operating criteria.

**III. POWER DELIVERIES**

**A. Delivery of the Canadian Entitlement**

The obligation of the United States to return the Canadian Entitlement to Canada for the Operating Year based on the AOP13 is:

Capacity Entitlement = 1,320.8 MW  
Energy Entitlement = 504.5 annual aMW

Arrangement for the delivery of this Canadian entitlement power, including the point of delivery, transmission losses, and scheduling guidelines, are defined by the Aspects Agreement, and Articles V and VIII of the Columbia River Treaty. Section 11 of Attachment B to the Aspects Agreement delegates to the Operating Committee the responsibility for modifying or amending Attachment B - Scheduling Guidelines, as needed from time to time.

**B. LCA Power**

In accordance with Section 7(b) of the LCA, the Canadian Entity shall deliver to the U.S. Entity one (1) average MW, shaped flat, during the Operating Year. In accordance with Section 10 of the LCA, the Entities shall deliver and receive power relating to the provisional draft of Arrow reservoir. The Entities hereby authorize and direct B.C. Hydro and BPA to make suitable arrangements for delivery of LCA power at the points of interconnection between B.C. Hydro and the Federal Columbia River Transmission System.

In the event of transmission limitations which curtail deliveries of energy under the LCA, curtailed deliveries shall be rescheduled for delivery as soon as it is practical after clearance of the limitation(s), but in no event longer than 168 hours later, unless mutually agreed otherwise.

**C. Operational Agreement Power**

In accordance with Section IV of this DOP, the Entities shall make arrangements to deliver and/or receive power required by any SOA. The Entities hereby authorize and direct B.C. Hydro and BPA to make suitable arrangements for delivery of Operational Agreement Power at the points of interconnection between B.C. Hydro and the Federal Columbia River Transmission System.

**IV. STORAGE OPERATION**

**A. Operation Authority**

The operation of Canadian storage by the Operating Committee during the period 1 August 2012 through 31 July 2013 shall be in accordance with this DOP, the FCOP, the LCA, and any SOA applicable to this Operating Year. Consistent with the operating objectives in this section, the Operating Committee is authorized to enter into SOAs consistent with the objectives defined in subsection IV(C) that store above or draft below end-of-month TSR levels, and may include the delivery of power, for mutual benefits that occur during the period covered by this DOP.

**B. Canadian Storage Operation**

The Weekly Treaty Storage Operation Agreements shall be based on operating Canadian storage to the end-of-month contents contained in the current TSR study, and any operations under SOAs and the LCA (as described in subsections C and D below), or as required by the FCOP.

From time to time, due to updated forecasts or differences between forecast and actual inflows, the actual operation of Treaty composite storage will differ from the end of period storage prescribed by the TSR as modified by SOA, LCA, or flood control operations. The Operating Committee will make reasonable efforts to correct these inadvertent differences via the regular Weekly Treaty Storage Operation Agreements in a timely manner without exceeding the specified project limits for discharges and ramp-rates.

**C. Objectives for Supplemental Operating Agreements**

Consistent with the FCOP and operating limits defined in Section VII of this DOP, the

objectives for SOAs include the following.

1. Power Objectives:

Power objectives include minimizing spill and optimizing energy production, power marketing, and purchase decisions. Operations for power objectives may be combined with non-power objectives. When appropriate, the Operating Committee will make suitable arrangements for delivery of power relating to sharing of benefits from operational agreements.

2. Non-power Objectives:

Potential Canadian non-power objectives may include, but are not limited to, whitefish and trout spawning downstream of Arrow, dust storm avoidance upstream of Arrow, and recreation needs. Potential U.S. non-power objectives may include, but are not limited to, storage of water up to 1.233 km<sup>3</sup> (1 Maf) for anadromous fish flow augmentation, minimum flows at Bonneville dam and at Vernita Bar for fish spawning, and recreation needs. Non-power objectives considered in this section do not include flood control and operating limits in Section VII.

Recognizing that it may not be possible to meet all non-power objectives, the Operating Committee shall in general attempt to share equally the risk and amount of failure. The parties shall make reasonable efforts to use available flexibility at their projects prior to requesting changes to the Treaty storage operation.

Operations designed to help meet non-power objectives do not imply that either Entity acknowledges any obligation, domestic or international, to meet those objectives. The Entities agree that operations for non-power objectives do not set a precedent concerning any current or future dispute over Treaty rights and obligations, nor do they set a precedent for non-power objectives or flow objectives and contents.

**D. Provisional Draft at Arrow**

The Canadian Section of the Operating Committee may provisionally draft from Arrow reservoir below TSR levels in accordance with Section 10 of the LCA.

**E. General Storage Operation Guidelines**

The values used in the AOP studies to define the various rule curves were period-end values only. In actual operation, it is necessary to operate in such a manner during the course of each period that these period-end values can be achieved in accordance with the operating rules. Due to the normal variation of power load and streamflow during any period, straight-line interpolation between the period-end points should not be assumed. During the storage drawdown season, Canadian storage should not be drafted below its period-end point at any time during the period unless it can be conservatively demonstrated that sufficient inflow is available, in excess of the minimum outflow required to serve power demand, to refill the reservoir to its end-of-period values as required.

## V. SCHEDULING STORAGE REGULATION

### A. **Operating Data**

The Operating Committee will exchange all current operating data necessary for the regulation of Canadian storage projects as soon as available, including the beginning and end of the flood control season.

### B. **Volume Runoff Forecasts**

Seasonal runoff volume forecasts for Canadian Treaty Projects shall be made available by the Canadian Section no later than the fifth working day of each month, as required. The Operating Committee may request forecasts of seasonal runoff volume at periods other than those representing month-end conditions if hydrologic conditions warrant. Seasonal runoff volume forecasts for the Columbia River at The Dalles, Oregon, shall be made available by the U.S. Section no later than the fifth working day of each month, as required.

### C. **Treaty Storage Regulation Study**

The TSR study is performed at least twice each month (within the first nine working days and the last eight working days of each month, unless otherwise agreed by the Operating Committee). Actual unregulated streamflows and forecasted unregulated streamflows will be updated for each TSR study. Variable refill curves, flood control storage evacuation requirements, and variable flood control refill curves will be updated for the first TSR of the month. At the request of either section of the Operating Committee, additional TSR studies shall be performed to reflect the most current unregulated streamflow forecasts and rule curves. The Operating Committee shall agree on procedures for developing streamflow forecasts and rule curves at that time.

Errors and omissions in the TSR will be handled as follows, unless otherwise agreed:

1. All identified errors, omissions, or revisions in the TSR issued during the current Operating Year should be documented and reported to the Operating Committee.
2. Errors/omissions identified within two working days of the initial TSR distribution which, in the view of either Section, may affect the final TSR for the previous operation period or which may impact operations prior to issuance of the next TSR, should be corrected immediately and the TSR re-run. If such errors/omissions are identified after the two-day review period, the TSR will be corrected only if requested by either Section of the Operating Committee.
3. Errors/omissions that do not affect the final TSR for the previous period or impact operations prior to issuance of the next TSR should be corrected in the subsequent TSR.
4. Errors/omissions that affect periods previously finalized and which result in a significant impact to the TSR in future periods, should be brought to the attention of the Operating Committee for resolution.

During the Flood Control Storage Evacuation Period and the Flood Control Refill period,

project Flood Control Curves will be determined in August 2012 and January through July 2013 by the Columbia Basin Water Management Division, Northwestern Division, U.S. Army Corps of Engineers, in accordance with the FCOP. These curves will be computed consistent with the timing of the TSR Schedule.

**D. Scheduling Agreements**

Unless otherwise agreed, requests by the U.S. Section of the Operating Committee for the regulation of the Canadian storage content will be made to the Canadian Section on a regular basis in accordance with the following procedures:

1. Storage Regulation for Power Operations

- a) Timing: A preliminary request will be made during a weekly conference call or other agreed means not later than noon each Thursday, followed by a final agreement by noon Friday, or the last working day of the week.
- b) Confirmation: The agreed operation will be confirmed in a Weekly Treaty Storage Operation Agreement transmitted via electronic mail or fax on Friday, or the last working day of the week, in accordance with the following format unless otherwise agreed:

This message confirms our verbal agreement on \_\_\_\_\_ (date)  
that the \_\_\_\_\_ (storing/drafting) of an estimated \_\_\_\_\_ ksf/d \_\_\_\_\_ (in/from)  
the whole of Canadian storage for the Period \_\_\_\_\_ through \_\_\_\_\_ is  
consistent with the Detailed Operating Plan (DOP).

This agreement is based on an estimated average inflow during the above-mentioned period of \_\_\_\_\_ kcfs to Duncan Reservoir,  
\_\_\_\_\_ kcfs to Libby Reservoir,  
\_\_\_\_\_ kcfs to Mica Reservoir, an  
Estimated average regulated inflow of \_\_\_\_\_ kcfs to Arrow Reservoir, and an  
Estimated regulated outflow of \_\_\_\_\_ kcfs from the Libby Project,  
That will result in average weekly Treaty discharges of \_\_\_\_\_ kcfs from the Duncan Project,  
\_\_\_\_\_ kcfs from the Mica Project, and  
\_\_\_\_\_ kcfs from the Arrow Project.

This operation of the whole of Canadian storage is based on the \_\_\_\_\_ (date)  
DOP TSR expected end-of-\_\_\_\_\_ (month, except split April & August) storage  
level for the whole of Canadian storage of \_\_\_\_\_ ksf/d.  
This operation includes expected \_\_\_\_\_ (storage above/draft below) the  
end-of-\_\_\_\_\_ (month, except April & August) DOP TSR level for the whole of  
Canadian storage of \_\_\_\_\_ ksf/d.

Treaty discharges will be made effective at the Canadian-United States border. The Weekly Treaty Storage Operation Agreement will be deemed to have been fulfilled if the total amount of Treaty water agreed to is released from Arrow plus Duncan reservoir provided an amount equal to or greater than the water released from Duncan reservoir is concurrently discharged from Kootenay Lake.

- c) SOAs and LCA: The Weekly Treaty Storage Operation Agreements shall indicate storage operations under any SOA or LCA activity.
- d) Period Covered by Weekly Treaty Storage Operation Agreement: The period covered by the agreement shall be from Saturday following the date of the weekly request to the following Friday.
- e) Release Determination: The amount of water released or stored during the period of the Weekly Treaty Operation Storage Agreement will be determined by the changes in reservoir contents based on the recorded reservoir elevation and storage capacity tables for Duncan (Exhibit 13), Arrow (Exhibit 14), and Mica (Exhibit 15). The change in Arrow storage content will be determined using the recorded reservoir elevation at the gauge near Fauquier, B.C.
- f) Modification: If any modification to a written Weekly Treaty Storage Operation Agreement is agreed by the Operating Committee, a further written Storage Agreement superseding the original will be dispatched immediately by the U.S. Section of the Operating Committee to the Canadian Section of the Operating Committee. In accordance with Section 12 of the LCA, the Canadian Section shall implement at the request of the U.S. Section, up to five (5) mid-week requests for changes to the Canadian storage operation, consistent with this DOP and operating agreements entered into pursuant to this DOP. In addition, upon receipt of the preliminary weekly request each Thursday, the Canadian Section may request a modification to the current week's Treaty Storage Operation as may be necessary to meet flow ramping and fish salvage requirements in transitioning project releases from one Treaty week into the next, subject to agreement by the U.S. Section.
- g) Provisional Draft: A preliminary request by the Canadian Section for provisional draft from Arrow reservoir, in accordance with Section 10 of the LCA, shall be made concurrent with the preliminary flow request. The provisional draft request will be confirmed not later than 2:00 pm on Thursday, and subsequently documented in the Weekly Treaty Storage Operation Agreement.
- h) Non-routine Operation: Any special operation that is agreed to by the Operating Committee will be suitably documented.

2. Storage Regulation during Flood Control

- a) Forecasts: Daily time-step streamflow forecasts will be accomplished by use of computer simulation by the National Weather Service River Forecast Center. The regulation center required by the FCOP for the flood regulation will be located in the Columbia Basin Water Management Division, Northwestern Division, U.S. Army Corps of Engineers offices in Portland, Oregon.
- b) Requests for Project Outflows: Pursuant to the operating rules in the FCOP, the outflows from individual Canadian storage projects may be specified, as outlined in the FCOP. Requests will be coordinated by telephone daily or on

an as needed basis, by conference calls between members of the Operating Committee or their representatives. The requests will normally prescribe the requested outflows as a mean daily discharge in cubic feet per second, for the 24-hour period from noon to noon of each day. Requests for project outflows will be determined by methods as agreed upon, and documented with a confirmation agreement by a message transmitted via e-mail or Fax from the Corps of Engineers, in Portland, Oregon. The Canadian Section of the Operating Committee or their representative will make acknowledgment of this agreement via e-mail or Fax. Any modification of the documented daily request shall be agreed by the Operating Committee before being put into effect, and shall be documented immediately using the procedure described above.

- c) Regulation during Winter Floods: Daily requests for project outflows from Canadian projects are normally implemented in the flood control refill period. During the occurrence of winter floods (periods of high winter flows) in the Lower Columbia River, if a special regulation of Arrow storage becomes necessary to preserve the natural flood control storage effect, then the outflows from Arrow will be regulated on a day-to-day basis by agreement of the Operating Committee in accordance with the requests of the U.S. Section of the Operating Committee. Insofar as possible the outflows from Arrow will not exceed the calculated natural lake outflows until the space obligated for this purpose as shown on Chart 5 of the FCOP is filled. The requests for such regulation will be in accordance with procedures described above. If, as a result of operation for winter flood control, a reservoir ends up above its flood control rule curve, then an appropriate outflow schedule for that reservoir will be determined to ensure that the reservoir will be drafted to its flood control rule curve as soon as feasible.

## **VI. OPERATING GUIDES**

### **A. Operating Rule Curve**

The ORC for the whole of Canadian storage shall be the sum of the ORCs for each of Duncan, Arrow, and Mica. The ORC for each of the Duncan, Arrow, and Mica Reservoirs during the period 1 August 2012 through 31 July 2013 is determined in accordance with the reference documents of Section I, and is defined as follows:

1. During the period 1 August 2012 through 31 December 2013, the ORC is the higher of the First Critical Rule Curve or the Assured Refill Curve.
2. During the period 1 January 2013 through 31 July 2013, the ORC is the higher of the First Critical Rule Curve or the Assured Refill Curve, unless the Variable Refill Curve (VRC) is below the higher of the above two curves (but no lower than the VRCLL), then it is defined by the VRC.
3. During the period 1 January 2013 through 15 April 2013, the ORC will not be lower than the Operating Rule Curve Lower Limit designed to protect firm loads with recurrence of 1936-37 hydro conditions unless a lower reservoir elevation is required for flood control (Exhibit 6).

4. During any month in the Operating Year, the ORC will not be higher than the Flood Control Rule Curve, defined as the maximum elevation of each reservoir established by flood control requirements and may be modified on mutual agreement for construction and other contingency requirements.
5. Operation of Mica will be in accordance with the Mica Project Operating Criteria tabulated with specified qualifications in Section VII(C). Differences between Mica's storage operation and its ORC (or Proportional Draft Point (PDP) if different) shall be balanced with equal and opposite changes to Arrow's ORC (or PDP) to the extent possible within agreed Operating Limits. The obligation to operate Mica and Arrow to produce optimum benefits in Canada and downstream in the United States will be deemed to have been fulfilled by operating to these criteria.
6. The VRCs for Arrow, Duncan, and Mica shall be constructed based on procedures, power discharge requirements as specified in Exhibit 7 (Total Inflow Method), except that the Operating Committee, in consideration of mutually beneficial operating arrangements, may agree to use an alternate procedure for Arrow which uses Arrow local inflows (Arrow Local Inflow Method) as follows.
  - a) If the current TSR study shows for the end of the current month that 1) the projected Mica Treaty storage content is lower than its ORC, and 2) the Coordinated System draft point is on the ORC, then the TSR shall be rerun with Arrow's VRC calculated as follows:
    - i) The forecast volume of inflow for Arrow will exclude the volume of inflow above the Mica project. This Arrow local inflow volume will be reduced by a forecast error such that there is a 95 percent probability that the reduced forecast is equaled or exceeded.
    - ii) The total Mica target outflow as specified in VII(C) will be added to the forecast volume described in a(i) above.
    - iii) In computing water available for refill of Arrow Reservoir the power discharge requirements for Arrow as specified in Exhibit 7 will be deducted from the volume calculated in a(ii).
  - b) During any period when the Arrow Local Inflow Method is used, the Mica/Arrow balancing (as described in subsection VI(A)5) is not used. This is implemented in BPA's hydro regulation model by setting the composite ORC for Canadian storage equal to the Mica Treaty storage content as defined in subsection VII(C), plus the ORC at Arrow and Duncan.

**B. Rule Curves and Operating Data**

Rule Curves and operating data are shown in both English and SI (Metric) units. SI values are displayed with either one or two decimal places to assure consistency with English units and do not imply that level of precision.

1. Assured Refill Curve for Duncan, Arrow, and Mica. Exhibit 1

**C. Reservoir Capacity Tables**

The following tables shall be considered to be the official storage for the projects:

- |    |   |            |
|----|---|------------|
| 1. | Duncan Reservoir Capacity Table (based on B.C. Hydro Table dated 21 February 1973).                 | Exhibit 13 |
| 2. | Arrow Reservoir Capacity Table (based on B.C. Hydro Combined Storage Table dated 28 February 1974). | Exhibit 14 |
| 3. | Mica Reservoir Capacity Table (based on B.C. Hydro Table dated 25 March 1974).                      | Exhibit 15 |

**VII. OPERATING LIMITS**

**A. Duncan Project**

1. Maximum outflow is 566.34 m<sup>3</sup>/s (20,000 cfs) through outlets but limited to 283.17 m<sup>3</sup>/s (10,000 cfs) each month in the TSR model.

2. Minimum average weekly outflow is 2.83 m<sup>3</sup>/s (100 cfs).
3. Maximum rate of change in outflow is normally 113.27 m<sup>3</sup>/s (4,000 cfs) per day unless a larger change is necessary to accomplish the objectives of the FCOP.
4. Normal full pool elevation is 576.68 m (1,892.0 feet).
5. Normal minimum pool elevation is 546.87 m (1,794.2 feet).
6. Normal maximum reservoir average monthly draft rate in elevation during any month is limited to 0.30 m (1 foot) per day.

**B. Arrow Project**

1. Maximum outflow is limited to physical capability, except during January when Attachment C to the LCA requires that outflows in actual operations be limited to a maximum of 2,265 m<sup>3</sup>/s (80,000 cfs). This January outflow limit applies to average weekly flows and may be exceeded if otherwise agreed or higher outflows are needed to meet flood control requirements or compensate for Duncan underruns.
2. Minimum average weekly outflow is 141.58 m<sup>3</sup>/s (5,000 cfs).
3. Maximum rate of change in outflow is normally 424.75 m<sup>3</sup>/s (15,000 cfs) per day unless a larger change is necessary to accomplish the objectives of the FCOP.
4. Normal full pool elevation is 440.13 m (1,444.0 feet).
5. Normal minimum pool elevation is 419.98 m (1,377.9 feet).
6. Normal maximum reservoir average monthly draft rate in elevation during any month is limited to 0.30 m (1 foot) per day.
7. The Arrow reservoir storage operation in the TSR will be limited by a maximum outflow, minimum outflow, or a maximum storage level as defined by the Arrow Project Operating Criteria (APOC) as shown in Table 1. The APOC includes the following:
  - a) Arrow's outflows will be limited, under all water conditions, to a maximum monthly outflow of 1,982 m<sup>3</sup>/s (70,000 cfs) in January and 1,699 m<sup>3</sup>/s (60,000 cfs) in February, subject to flood control requirements.
  - b) The minimum average monthly outflow is increased from 142 m<sup>3</sup>/s (5,000 cfs) to 283 m<sup>3</sup>/s (10,000 cfs) for July through January, 566 m<sup>3</sup>/s (20,000 cfs) for February and March, 425 m<sup>3</sup>/s (15,000 cfs) for April 1-15, 283 m<sup>3</sup>/s (10,000 cfs) for April 15-30 and May, except that the minimum monthly outflow will be decreased as needed (but limited to no lower than 142 m<sup>3</sup>/s (5,000 cfs)) to prevent the combined draft of Mica and Arrow from exceeding 17.39 km<sup>3</sup> (14.1 Maf).
  - c) Arrow's storage contents during February through June are limited to a

calculated maximum level depending on the forecast for The Dalles residual unregulated runoff for the current month through July.

- d) APOC Implementation: In the DOP, the default implementation of the APOC will use the distribution factors shown in Table 2. These distribution factors are multiplied by the current month through July forecast volumes at The Dalles, to calculate future month through July volume forecasts. The resulting residual month-July volumes are then used to determine the maximum storage levels from the criteria provided in Table 1.

**TABLE 1**  
**ARROW PROJECT OPERATING CRITERIA 1/**

Period	Volume Runoff Period	The Dalles Volume Runoff				Maximum Storage Limit 2/ & 3/		Maximum Outflow Limit 4/		Minimum Outflow Limit 5/	
		km <sup>3</sup>	Maf	Maf	km <sup>3</sup>	ksfd	hm <sup>3</sup>	kcfs	m <sup>3</sup> /s	kcfs	m <sup>3</sup> /s
January						URC	URC	70	1982	10	283
February	1 Feb - 31 Jul	>86.3	>70	to	<80 <98.7	URC to	1800 4403.8	60	1699	20	566
March	1 Mar - 31 Jul	>80.2	>65	to	<75 <92.5	URC to	900 2201.9			20	566
April 15	1 Apr - 31 Jul	>75.2	>61	to	<70 <86.3	URC to	900 2201.9			15	425
April 30	1 Apr - 31 Jul	>75.2	>61	to	<70 <86.3	URC to	1000 2446.6			10	283
May	1 May - 31 Jul	>83.9	>68	to	<70 <86.3	URC to	2100 5137.8			10	283
June	1 Jun - 31 Jul	>40.7	>33	to	<35 <43.2	URC to	3400 8318.4			5	142
July - December						URC	URC			10	283

**Notes:**

1. All APOC limits apply to the TSR study only.
2. If the Maximum Storage Limit is computed to be above the URC, then the URC will apply.
3. Interpolate when there are two values. For example, if the February-July volume runoff is between 86.3 km<sup>3</sup> (70 Maf) and 98.7 km<sup>3</sup> (80 Maf), then the Maximum Storage Limit is interpolated between February's URC and 4403.8 km<sup>3</sup> (1800 ksf).
4. The Maximum Average Monthly Outflow Limit takes precedence over the Maximum Storage Limit. However, the Maximum Outflow Limit may be exceeded to avoid storage above the URC.
5. The Minimum Average Monthly Outflow Limit is an operating limit and may be reduced to as low as 142 m<sup>3</sup>/s (5,000 cfs) (Treaty minimum) to avoid drafting Mica+Arrow storage beyond 17.39 km<sup>3</sup> (14.1 Maf).

TABLE 2

## APOC IMPLEMENTATION: DISTRIBUTION FACTORS FOR THE DALLES

Forecast Date	Forecast Period	The Dalles Distribution Factors					
		Jan-Jul	Feb-Jul	Mar-Jul	Apr-Jul	May-Jul	Jun-Jul
1-Jan	1 Jan - 31 July	1.0000	0.9392	0.8589	0.7735	0.7174	0.4393
1-Feb	1 Feb - 31 July		1.0000	0.9145	0.8235	0.7638	0.4677
1-Mar	1 Mar - 31 July			1.0000	0.9005	0.8352	0.5114
1-Apr	1 Apr - 31 July				1.0000	0.9275	0.5679
1-May	1 May - 31 July					1.0000	0.6123
1-Jun	1 Jun - 31 July						1.0000

**Notes:**

1. Unless otherwise agreed, the DOP13 will apply these distribution factors to the monthly volume forecast at The Dalles for computing the Month-July runoff volumes required by the APOC.
2. These distribution factors are calculated from the median 71 year Jan-Jul, Feb-Jul, etc., volumes. For example, if the 1 May volume runoff forecast equals 80.2 km<sup>3</sup> (65 Maf), then based on the June-July distribution factor of 0.6123, the estimated June-July volume runoff is 49.1 km<sup>3</sup> (39.8 Maf), and from Table 1, the Arrow maximum storage limits in May and June are the URC and 8318.4 hm<sup>3</sup> (3400 ksf) respectively.

**C. Mica Project**

The Mica Project Treaty storage operation in the TSR will be according to the Mica Project Operating Criteria shown in Table 3 (and Table 3M) except as qualified in subsections VII(C)1 through VII(C)6.

1. VRCs shall be constructed according to Exhibit 7 with the 31 July Treaty storage content of 8,634.5 hm<sup>3</sup> (3,529.2 ksf). However, the Operating Committee may agree to set Mica's VRC July refill target equal to the Mica End of Month Storage Content of 8,482.8 hm<sup>3</sup> (3,467.2 ksf) indicated on the following "Mica Project Operating Criteria" table.
2. Mica project operation will be determined by the End of Previous Month Arrow Storage Content as shown in Table 3 (and Table 3M), except for the limitations or changes required by subsections VII(C)3 through VII(C)6. The End of Previous Month Arrow Storage Content shall be determined from the current TSR study, except when the Arrow Local Inflow Method was used for the prior month the TSR with the Arrow Total Inflow Method shall be used. Mica's target operation will be defined either by a Target End of Month Storage Content or a Target Month Average Outflow.
3. Mica operation to the Target End-of-Month Treaty Storage Contents shall be limited by the Minimum and Maximum Outflows shown in Table 3 (and Table 3M),

unless needed to accomplish the objectives of the FCOP.

4. Mica operation to the Target Month Average Outflow shall be limited by the Minimum Target Treaty Content shown in Table 3 (and Table 3M). Mica outflows shall be reduced as required down to a lower limit of the Minimum Outflow shown in the table below, to prevent draft below the Minimum Target Treaty Storage Content. Minimum Outflows may cause the reservoir to draft below the Minimum Target Treaty Content.
5. Mica outflows will be increased during the months October through July as required to avoid violation of the Flood Control Rule Curve.
6. Treaty storage releases from Mica in excess of 8.634 km<sup>3</sup> (7 Maf) that result from operating Mica under the criteria described in VII(C)2 through VII(C)5 above will be retained in the Arrow reservoir, subject to flood control and minimum flow requirements at Arrow, and Mica will be reduced to Minimum Outflow as required to minimize releases in excess of 8.634 km<sup>3</sup> (7 Maf). The total combined storage draft from Mica and Arrow will not exceed 17.392 km<sup>3</sup> (14.1 Maf) unless flood control or minimum flow criteria at Arrow will not permit the excess Mica storage releases to be retained at Arrow. If such a release should occur, the target Mica operation will remain as specified in Mica Project Operating Criteria, and the excess release will be returned as soon as the operating criteria permit.

Table 3

	0 - 1,160	31,000	-	0.0	-	10,000

Notes:

- 1/ If the Mica target End-of-Month Storage Content is less than 3529.2 ksf, then a maximum outflow of 34,000 cfs will apply. These maximum flows may be exceeded for flood control.
- 2/ For month average outflow target operation, Mica outflows will be reduced to minimum to maintain the reservoir above the Minimum Target Treaty Storage Content.
- 3/ Minimum outflow only applies if the Target Operation Month Average Outflow would result in a Mica content below the Minimum Target Treaty Content.

**Notes:**

1/ If the Mica target End-of-Month Storage Content is less than 8634.5 hm<sup>3</sup>, then a maximum outflow of 962.77 m<sup>3</sup>/s will apply. These maximum flows may be exceeded for flood control.

2/ For month average outflow target operation, Mica outflows will be reduced to minimum to maintain the reservoir above the Minimum Target Treaty Storage Content.

3/ Minimum outflow only applies if the Target Operation Month Average Outflow would result in a Mica content below the Minimum Target Treaty Content.

Notes on Exhibit 1 and Exhibit 1M:

- 1/ The Assured Refill Curve (ARC) indicates the end-of-month storage content required to assure refill of Canadian storage by 31 July based on 1931 historical monthly inflow. The monthly inflow at each reservoir is reduced by deducting the Power Discharge Requirements (PDR) and water required for refill, if any, at upstream reservoirs. The Entities may agree to revise the data upon the completion of the Refill Study by the Operating Committee.
- 2/ Upstream refill requirement: these values are computed by subtracting current month from previous month's higher of Mica's ARC or first critical rule curve (CRC1) except July value is Mica full minus previous month's higher of Mica's ARC or CRC1. CRC1 is shown in Exhibit 2.
- 3/ Inflows are from the 2000 Level Modified streamflow (HydSim file).
- 4/ PDRs are from the AOP13.

### Exhibit 7 - Variable Refill Curve Procedures (English)

The Variable Refill Curves (VRCs) indicate the end-of-month storage content required to refill Canadian storage based on forecasts of unregulated inflow volume. The probable forecast volume at each reservoir is reduced by deducting the 95 percent confidence forecast error, Power Discharge Requirements (PDRs), and water required for refill at upstream reservoirs based on the ORC.

**POWER DISCHARGE REQUIREMENTS, IN CFS  
FOR  
JANUARY - JULY VOLUME RUNOFF OF THE COLUMBIA RIVER AT THE DALLES, OREGON**

110 Maf PDRs	100	100	100	100	100	100	600	1000

Notes:

- (1) If the forecasted natural January through July volume runoff at The Dalles is less than 80 Maf, the Power Discharge Requirement in the 80 Maf schedule will be used. For intermediate forecasted volumes, the Power Discharge Requirement will be interpolated linearly between the values shown above.
- (2) PDRs are from the AOP13. Data may be revised upon completion of any Refill Studies agreed to by the Operating Committee.
- (3) Distribution factors and forecast errors are shown in Appendix 8 of the 2003 POP, as revised by the Operating Committee.

### Exhibit 7M - Variable Refill Curve Procedures (SI)

The Variable Refill Curves (VRCs) indicate the end-of-month storage content required to refill Canadian storage based on forecasts of unregulated inflow volume. The probable forecast volume at each reservoir is reduced by deducting the 95 percent confidence forecast error, Power Discharge Requirements (PDRs), and water required for refill at upstream reservoirs based on the ORC.

Notes: Data for columns 1, 2, and 3 are from DDPB Table 1A of the AOP13. References to line numbers in the notes below are references to lines in DDPB Table 1A of the AOP13.

- 1/ The Pacific Northwest Area Firm Load including pumping, but excluding Utah Power and Light loads in Idaho (line 1d).
- 2/ Includes total power flows out (line 2i), total load served by flows-in (line 3f), load served by other resources (lines 4f – 4b), total thermal installations (line 7), and hydro maintenance (line 8a). Other resources include hydro independents (1929 for example) that will be updated as described in subsection II(D)3.
- 3/ AOP13 Coordinated Hydro Model Load, DDPB Table 1A, line 10.
