

APPENDIX F

BIOLOGICAL OPINION SPILL

BiOp SPILL CALCULATIONS.

By: Scott Boyd
November 3, 2003

Spill calculations

The calculations of BiOp spill for juvenile fish passages are based methods I have been using for several years to monitor how well the projects and BPA are implementing juvenile fish spill based on the instructions given to the projects and BPA by the Corps via teletypes. I have developed excel spreadsheets that display the actual project spill and calculate the spill specified for juvenile fish passage (BiOp spill). I display both these values on a graph so that with a quick glance I can see how the project and BPA are doing.

The functions that I have developed, to calculate BiOp spill, take into consideration the BiOp spill requirements, the 120/115% gas cap in effect, the minimum generation requirements, any major tests that are going on during the spill season, and in some cases the 1% efficiency unit operating requirements. I am glad to share the code (visual basic) I use. Each project has it's own function. Each year I have to modify several of the functions to take in to consideration any changes in effect for the current year. These changes are usually due to research ongoing at the project (Like the RSW test at Lower Granite). Sometimes changes are needed due to changing instructions to the project. For example in 2001 there was a minimum spill level of 15 kcfs set at The Dalles. I do not always adjust my functions to take care of short tests at projects, like a three-day spill test, or other short-term regulation changes.

One item to consider when seeing if the projects and BPA are complying with their instructions is the how the projects operate the spill gates. The spill gates are opened a number of stops. These stops are a set distance. For example, a stop may be 1 foot. The project can open the gate 1 stop (1 foot) or 2 stops (2 feet) but not 1.5 stops. This means that the project can spill certain amounts; lets say for example 98 kcfs or 102 kcfs (each additional stop open increases spill 4 kcfs) but not 100 kcfs. So if the spill cap at the project were 100 kcfs the project would spill 98 kcfs not 102 kcfs, which would be over the spill cap. See the spill patterns in the Fish Passage Plan for examples of this.

Project specific info for the 2003 spill season.

BON

Spill started 4/14 at 0500. From 4/14 to 6/26 daytime spill alternated between 75 kcfs (fallback limit) and spilling to the gas cap. The purpose of alternating the spill was to determine the effect of the spill level on adult passage. After 6/27 the daytime spill was at the 75 kcfs (fallback limit). Spill ended 8/31 2400.

TDA

Spill started 4/14 at 1800. On 4/17 from 0700 – 1700 spill was limited to bays 12 – 22 so the fish release pipe could be reinforced. From 5/20 to 6/10 a series of special spill amounts and spill patterns were used as part of a balloon tag test. The purpose of this test was to test juvenile fish survival. The spill patterns used were for a four per-bay discharges (9, 12, 18 and 21 Kcfs) to approximate stilling basin hydraulic conditions that would occur below bays 2 and 4 as if there were a training wall running from pier 7 to the endsill. Spill ended 8/31 2400.

JDA

There was a spill for hydraulic data collection 4/10. Spill for juvenile fish passage started 4/14 at 1800. From 4/18 to 6/8 nighttime spill alternated between 45% and 60% of total flow. From 6/27 to 7/21 the spill alternated between 0% daytime/ 60% nighttime spill and 30% spill all day. The purpose of these tests was to determine the effect of juvenile fish passage and survival on different levels of spill. Spill may be adjusted for navigation purposes. Spill ended 8/31 2400.

MCN

Spill started 4/14 at 1800. Spill may be reduced to help to juvenile fish barge loading. No spill 4/28 from 1000 – 1200 to adjust fish tracking equipment. Due to problems with gate hoists the spill pattern used was changed several times. Spill ended 6/20 0600.

IHR

Spill started 4/9 at 1800. From 4/23 to 7/25 spill alternated between the BiOp spill amount and spilling 50% of the project outflow. The purpose of this test was to determine the effect of juvenile fish passage and survival on different levels of spill. On 6/13 and 6/23 from 1300 – 1600 spill was limited to bays 4-6 in order to remove and then reinstall some equipment. Several different spill patterns were tested in order to see the effects the patterns had on juvenile fish mortality and injury. From 6/24 to 7/16 spill was alternated between the BiOp spill amount in a bulk spill pattern and no spill. Again this test was to determine the effect of these changes of juvenile fish passage and survival. On 7/15 a balloon tag test occurred in the spillway. On 7/17 spill was changed to spill from 2000 – 0800 and no spill from 0800 – 2000. Again this test was to determine the effect of these changes of juvenile fish passage and survival. Spill ended 8/31 2400.

LMN

Spill started 4/7 at 1800. Spill was either 45% or 50% of the total project outflow depending on the outflow. The amount of spill from bays 1 and 8 due to problems high spill was causing. Spill was used for debris removal several times. Spill ended 6/20 at 0600.

LGS

Spill started 4/5 at 1800. Spill ended 6/20 0600.

LWG

Spill started 4/3 at 1800. From 4/14 to 5/30 spill alternated between spilling according to the BiOp and spill using the RSW (Removable spillway weir). Spill and the RSW were used for debris removal several times. Spill ended 6/20 0600.
